

4. Bullish vs. Bearish Markets:

- **Bullish (Upward Trend):** Price forms **Higher Highs (HH)** and **Higher Lows (HL)**.

- **Bearish (Downward Trend):** Price forms **Lower Lows (LL)** and **Lower Highs (LH)**.

5. Trend Reversals/Shift of Trend and Structure:

- A trend becomes **bearish** when price closes below a Higher Low (HL).

- A trend becomes **bullish** when price closes above a Lower High (LH).

6. Formation of New Highs and Lows:

- When price closes above a Higher High (HH), a new HH and HL are formed.
- When price closes below a Lower Low (LL), a new LL and LH are formed.
- The point before a push to a new HH is the new HL, and the point before a push to a new LL is the new LH.

Identifying Trends and Key Levels

1. Timeframe Analysis:

- Identify trends on **Weekly (W)**, **Daily (D)**, and **4-hour (4hr)** timeframes.
- Mark highs and lows with lines, using body closures, not wicks.

2. Consecutive Timeframes in Sync:

- Focus on pairs where at least **two consecutive timeframes** are in sync (e.g., W bearish, D bullish, 4hr bullish).

- Place alarms where the 4hr timeframe could resync with the others, if you see a pair with potential that's currently not in sync.

3. Top Pair Selection:

- Evaluate pairs during the **weekend** to identify those with consecutive timeframes in sync.
- Disregard pairs consolidating for extended periods or showing no potential.

4. Finding Valid HLs and LHs When Unsure:

- Use AOIs to find valid HLs or LHs:
 - Place a small box to validate AOIs (body touches, not wicks).
 - If there's no body touch, it's not a valid HL or LH.
- AOIs are critical for retracements and trend reversals.

Trading Around AOIs (ONCE AOIs ARE ESTABLISHED)

1. Retracements and AOI Interaction:

- A **bullish W and D trend** may require the 4hr timeframe to go bearish for a retracement. But this is okay since we hopefully still have 2 timeframes in sync.

- If the retracement causes the D timeframe to turn bearish, we shift our focus to **selling** instead of buying.

- A **bearish W and D trend** may require the 4hr timeframe to go bullish for a retracement. But this is okay since we hopefully still have 2 timeframes in-sync.
- If the retracement causes the D timeframe to turn bullish, we shift our focus to **buying** instead of buying.

2. Switching from Buy to Sell and Vice Versa:

- When retracement turns the D bearish:
 - Sell from a **D AOI** (not W AOI), as the W remains bullish.
 - The sell might serve as the retracement to the original W AOI, where price may eventually go up.

- Real example:

- When retracement turns the D bullish:
 - Buy from a **D AOI** (not W AOI), as the W remains bearish.
 - The buy might serve as the retracement to the original W AOI, where price may eventually go down.

3. Avoiding Incompetent Trades:

- Never sell from a D AOI when you're near/approaching closely to a W AOI when the W is bullish and the D is bearish, as the price could react strongly from the W AOI, and prematurely rocket into your stop loss.

Daily

- Never buy from a D AOI when you're near/approaching closely to a W AOI when the W is bearish and the D is bullish, as the price could react strongly from the W AOI, and prematurely rocket into your stop loss.

4. Alerts and Monitoring:

- Instead of totally discarding pairs without in sync timeframes, place alerts where 4hr timeframe could re-sync again, after it has rejected the AOI, and

then wait for pullback opportunities back into the AOI, or near the AOI (higher risk).

- Continuously reassess the trend on W, D, and 4hr timeframes for updates.

Risk Management

1. Avoid Extreme Market Levels:

- Don't trade above the **highest high** or below the **lowest low** in market history due to lack of historical data to base trades, take profits and stop losses.

2. Avoid Consolidating Markets:

- Avoid pairs stuck in long-term consolidation with no clear potential.

Trade Evaluation

1. Understanding Price Movements:

- Assess where price is relative to AOIs:

- At the top of a move.

- On the way to an AOI.

- At the AOI.

2. Reanalysing Shifts:

- When trends shift (e.g., bullish to bearish), establish new AOIs based on the latest LLs and LHs.

3. Checklist:

- Revisit the trend analysis for W, D, and 4hr timeframes before every trade to confirm the trade is still viable, or if the timeframes are out of sync and what must happen for the trade become viable again.

Areas of Interest – Support and Resistance

Key Concepts

- **Support and Resistance:**
 - Support: A price level with a high probability of preventing the price from falling further.
 - Resistance: A price level with a high probability of preventing the price from rising further.
 - Support and resistance are also referred to as supply and demand zones.
 - Valid AOIs require at least three touches of support or resistance to be considered significant.

- **Timeframes:**
 - AOIs are identified only on **Daily (D)** and **Weekly (W)** timeframes for high-quality set-ups, as these are most respected by price and provide the greatest confirmation of support and resistance.

Purpose of AOIs

- AOIs help us determine potential buy or sell zones, as they represent areas where price has a high likelihood of reversing.

- Fake-outs can occur: Price might slightly overshoot an AOI before reversing, potentially misleading traders.

Marking AOIs

1. Initial Identification:

- After establishing the market trend on higher timeframes, AOIs are identified between:
 1. **Higher Highs (HH)** and **Higher Lows (HL)** in an uptrend.
 2. **Lower Lows (LL)** and **Lower Highs (LH)** in a downtrend.
- Mark potential AOIs with a horizontal line, focusing on areas with the most body touches.

- There is no maximum or minimum number of AOIs; identify all that the market presents.

2. Creating Zones:

- Convert horizontal lines into AOI zones using a rectangle to capture as many touches as possible in a narrow range.
- Avoid overly large zones; focus on the bulk of closures to keep the area confined.

- If W and D AOIs overlap then make them like the following:

3. Zone Characteristics:

- A valid AOI remains valid regardless of size or the number of touches.
- AOI zones should not exceed **60 pips** in width.
- **Bullish Trend:** HLs with three touches can act as AOIs. However, a close below an HL indicates a trend change.
- **Bearish Trend:** LHs with three touches can act as AOIs. However, a close below an LH indicates a trend change.

Further AOI Related Strategy

- **Waiting for Price to reach the AOI:**
 - The strategy is contingent on price reaching an AOI. No trades should be taken if price is outside the AOI, or more than **±5 pips** away.
 - Rank currency pairs based on proximity to AOIs or whether they're already at an AOI.
- **Waiting for a Break and Retest in relation to AOIs:**
 - If price closes below a D or W AOI during a buy scenario:
 - Wait for a break and retest above the AOI before considering a trade.
 - Ensure timeframes remain in sync to proceed with the trade.
- **Waiting for a reaction from a Valid AOI:**
 - Valid AOIs require a price reaction. If no reaction occurs at the first AOI, wait for price to react from the next AOIs.

Higher Risk Trades Away From The AOI

- High-risk trades occur when entering a position **after price has already rejected the Area of Interest (AOI)** and is in the middle of a move
-

1. Price Movement Post-AOI:

- Even if price moves away from the AOI without us entering, this does not guarantee it won't return to the AOI for another rejection.
- Entering trades mid-move carries higher risk due to reduced probability of another significant move in the desired direction.

2. Waiting for AOI Re-entry:

- To reduce risk, wait for price to return to the AOI before entering a trade.

- However, the moves occurring after a return to the AOI may not always be as strong as the initial move.
-

1. Tracking Key Pairs:

- If price rejects the AOI, add the pair to a **watchlist** to monitor further developments.
- Prioritize pairs currently at AOIs that are on your **hot list of pairs** with higher quality

2. Setting Alerts:

- Use alarms or alerts to notify you when price returns to the AOI, ensuring you don't miss potential re-entry opportunities.

Round Psychological Levels

Definition

- Round psychological levels are price points where banks and large institutions are likely to place significant buy and sell orders. These are typically rounded values such as **1.5000**, **0.8500**, etc.

- Alex refers to these as **“every 500”**, reflecting key levels spaced by increments of 500 units.

Characteristics

- Psychological levels are sometimes called **order blocks**.
- They are less likely to cause a reversal in price compared to Areas of Interest (AOIs), but they serve as an additional confluence when within an AOI.

Identification Process

1. Placement:

- Draw a horizontal ray within an AOI.
- Adjust the coordinates of the ray to the nearest “500” level (e.g., 1.5000, 1.4500).

2. Validation:

- If the adjusted level lies outside the AOI, discard it.
- If it lies within the AOI or is within **±5 pips** of the AOI, adjust the AOI to include the psychological level.

3. Exclusions:

- If no round psychological level exists within the AOI, ignore this factor.

Usage in Confluences

- **Current Price Rejection:**

- If the current price shows rejection from a round psychological level (indicated by wicks or candle bodies), it can be added to your list of confluences.

- Only include this confluence if the rejection is happening in **live price action**, not based on historical rejections far from the current price.

- **Appearing Only Once Within Confluences:**

- A psychological level should only appear once in your confluence analysis, regardless of the timeframe, as it is the same across all timeframes.

50 EMA Indicator

Definition

- The **50 EMA (Exponential Moving Average)** is a dynamic level of support and resistance, functioning similarly to Areas of Interest (AOIs) but with a much lower probability of causing a price reversal.

Characteristics

- **Purpose:**
 - The 50 EMA is used as an additional confluence, alongside AOIs and round psychological levels, to strengthen trade setups.
- **Behaviour:**
 - Price interactions with the 50 EMA are considered significant when the price is touching, hitting, or rejecting the EMA.
 - Valid rejections can occur from both **wicks and bodies**, indicating the EMA's effect on reversing price.

Usage in Confluences

1. Live Price Rejection:

- Include the 50 EMA in your confluences only if **live price action** is interacting with it.

- Rejections based on historical price movements far from the current price are **not considered valid**.

2. Rejections:

- A rejection occurs when price touches the EMA and moves in the opposite direction, leaving a wick. This demonstrates the EMA's force in reversing price.

3. Application Across Timeframes:

- The 50 EMA is observed and utilized on **all timeframes**.

Rejection From Previous Structure Points

Definition

- A **previous structure point** refers to a key level in the price action where significant turning points occurred, such as a high or low.
 - For example, in a bullish market, this could be the high preceding the current Higher High (HH).
 - It doesn't have to be the most recent HH or HL but rather the **previous H/elbow** in the market structure.
 - Using the "snake trick," it is identified as the **second turn** from the current HH or LL.

Characteristics

- **Role in Market Movement:**
 - In a bullish market, previous structure points can act as a level of support, pushing the price back up.

- In a bearish market, they can act as resistance, pushing the price down.
- **Rejections:**
 - A rejection occurs when price touches or approaches the previous structure point and reverses direction, leaving wicks or body rejections on the chart.

Usage in Confluences

1. Part of AOI:

- The previous structure point is only included in confluences if it aligns with the current **Area of Interest (AOI)** where the trade is being considered.

2. Validation:

- Rejections from previous structure points are considered valid when they involve live price action interacting with these levels, with visible body or wick rejections.

Candlestick Rejection Formations

Definition

- **Candlestick rejections** occur through specific candlestick formations, signalling that the price is reacting to an Area of Interest (AOI) and is likely to reverse direction.
-

Types of Candlestick Rejection Formations

1. Bullish Engulfing:

- Found at the end of a downtrend, retracement, or AOI.
- The second bullish candle fully engulfs the first bearish candle.
- **Signal:** Buyers overpower sellers, indicating a possible upward reversal.

2. Bearish Engulfing:

- Found at the end of an uptrend, retracement, or AOI.
- The second bearish candle fully engulfs the first bullish candle.
- **Signal:** Sellers overpower buyers, indicating a possible downward reversal.

3. Doji:

- Formed when the open and close prices are the same or nearly the same, reflecting market indecision.
- Found during consolidation or at key reversal points.

- **Signal:** Potential reversal when at the top or bottom of a trend/retracement or near an AOI.

4. Gravestone Doji:

- Bearish reversal pattern with a long upper shadow and open/close at the same level.
- **Signal:** Sellers overcame buyers, often found at the top of an uptrend or near AOIs.

5. Dragonfly Doji:

- Bullish reversal pattern with a long lower shadow and open/close at the same level.
- **Signal:** Buyers overcame sellers, often found at the bottom of a downtrend or near AOIs.

6. Morning Star:

- Bullish reversal pattern formed at the bottom of a downtrend/retracement.
- Composed of:
 1. Bearish candle.

2. Small candle (often a Doji).
 3. Bullish candle closing above the midpoint of the first.
- **Signal:** Likely beginning of an uptrend from strong AOIs.

7. Evening Star:

- Bearish reversal pattern formed at the top of an uptrend/retracement.
- Composed of:
 1. Bullish candle.
 2. Small candle (often a Doji).
 3. Bearish candle closing below the midpoint of the first.
- **Signal:** Likely beginning of a downtrend from strong AOIs.

8. Hammer/Pin Bar:

- Bullish reversal pattern with a small body at the top and a long lower shadow.
- **Signal:** Buyers rejected lower prices, indicating a potential upward move when near strong AOIs.

9. Shooting Star/Bearish Pin Bar:

- Bearish reversal pattern with a small body at the bottom and a long upper shadow.
- **Signal:** Sellers rejected higher prices, indicating a potential downward move when near strong AOIs.

10. Harami/Inside Bar:

- Two-candle pattern:
 - First candle is larger (mother candle).
 - Second candle is smaller, completely within the first candle's range.
- **Bullish Harami:** Reversal signal at the bottom of a downtrend or AOI.
- **Bearish Harami:** Reversal signal at the top of an uptrend or AOI.
- **Signal:** Consolidation and potential continuation if found within a trend.

11. Tweezer Top:

- Bearish reversal pattern at the top of an uptrend.
- Composed of a bullish candle followed by a bearish candle closing at the bullish candle's open.
- **Signal:** Sellers have overtaken buyers, indicating a sell opportunity at AOIs.

12. Tweezer Bottom:

- Bullish reversal pattern at the bottom of a downtrend.
- Composed of a bearish candle followed by a bullish candle closing at the bearish candle's open.
- **Signal:** Buyers have overtaken sellers, indicating a buy opportunity at AOIs.

Usage in Confluences

- Add these candlestick patterns to the **confluence list** only if they occur at an AOI.
- These patterns provide stronger validation for potential price reversals when combined with other factors like AOIs, psychological levels, or EMA interactions.

Market Patterns

Definition

- Market patterns are recurring structural shapes that appear repeatedly in the market, enabling traders to predict future price movements.
- Patterns formed on higher timeframes are more reliable and respected.
- The three key patterns used are:
 1. Break and Retest
 2. Head and Shoulders (and Inverted)
 3. Double Bottom/Top

1. Break and Retest

- **Type:** Trend Continuation Pattern.
- **Description:**
 - Price breaks through an Area of Interest (AOI) or structure point.
 - Retraces to the broken area, then rejects and continues in the direction of the trend.

- **Applicability:** Effective on all timeframes.
- **Purpose:** Used to position trades on the correct side of the AOI. **Not used as a confluence.**

2. Head and Shoulders (and Inverted)

- **Type:** Trend Reversal Pattern.
- **Description:**
 - Regular **Head and Shoulders** indicates a bearish reversal.
 - **Inverted Head and Shoulders** indicates a bullish reversal.
 - The "head" is higher (or lower, in the inverted version) than the two "shoulders."
 - Shoulders can vary in size and do not need to be symmetrical.
- **Validation:**

- For the pattern to be valid, price must close below (or above, in the inverted version) the neckline.

- Add to confluences when the pattern breaks and retests/rejects the neckline.

3. Double Bottom and Double Top

- **Type:** Trend Reversal Pattern.
- **Description:**
 - **Double Bottom** occurs when the price enters an AOI, rejects, attempts to break through again, but rejects a second time.
 - **Double Top** is the reverse, occurring in a bearish context.
 - Tops and bottoms do not have to be the exact same height but must align with the AOI.
- **Validation:**
 - For the pattern to be valid, price must close above (double bottom) or below (double top) the neckline.

- Add to confluences when price breaks and retests/rejects the neckline.

Usage in Confluences

- **Patterns included as confluences:**
 - **Head and Shoulders** (and Inverted).
 - **Double Bottom/Top.**
- **Patterns not included as confluences:**
 - **Break and Retest** – this pattern is used for determining the correct position relative to the AOI but is not considered a standalone confluence.

Entry, Take Profit and Stop Loss

Entry Signals

- **Definition:** An entry signal is the final step of a trading plan, signalling the execution of a trade. No trade should be entered without a confirmed entry signal, regardless of setup probability.
- **Shift of Structure:**
 - A shift of structure occurs when price changes its trend on a specific timeframe.

- Look for a shift of structure at the AOI, aligning with the desired trade direction (e.g., bullish for buys).
 - This shift doesn't need to occur strictly within the AOI box but must occur after price enters the AOI (within ± 5 pips tolerance).
 - Timeframes to observe: **4hr, 2hr, 1hr, 30min, 15min**. Choose the cleanest visible shift on one of these.
 - Lower timeframes often shift first, signalling a potential move.
- **No Shift, No Trade:**
 - If no shift of structure occurs or it happens too far from the AOI, avoid the trade.
 - **In Case of Price Moving Far from AOI:**
 - If the risk-to-reward (RR) ratio is insufficient, wait for a pullback. Do not chase trades.

- In **higher-risk** scenarios, where the shift occurs far from the AOI, you can adjust the stop loss to the last structure point of the retracement for a better RR

Exception With Shift of Structure – Found on Alex Post Bootcamp Recording 2

- As seen above Alex enters a short when there was no true, shift of structure. The price action mimicked a shift of structure, but a real shift would not have occurred until price closed below where the pointer is. This is because part of the retracement on the lower time frames consisted of completely bullish candles with no highs and lows, just one big move. This may be more high risk, and won't occur often. But the trade ended up playing out to TP

Confirmation: Engulfing Candlestick

- After the shift of structure, look for an **engulfing candlestick** on the same timeframes.
- **Key Points:**
 - Higher timeframe engulfing signals offer stronger confirmation.
 - Engulfing candles typically occur during high-volume sessions (e.g., London/New York).

- The ideal scenario: While the 4hr is already in sync, a 4hr timeframe engulfing candle will coincide with a lower timeframe shift of structure. We can enter right after the engulfing and shift are confirmed

- **Missed Entry:**

- If an engulfing candle forms and the entry is missed, wait for a pullback into an area with an acceptable RR.

- Post-pullback, wait for another engulfing candlestick before entering. A second shift of structure is not required unless the trend shifts unfavourably.

- **No Pullback?**

- Sometimes pullbacks don't happen or aren't sufficient for a favourable RR. Accept this and move on to other setups.

Take Profit (TP)

- **Definition:** A pre-determined price level to close positions and secure profits.
- **Placement:**
 - **Trading from a Daily AOI:** Place TP at or just below the closest respected daily structure point (e.g., current HH in a bullish market).
 - **Trading from a Weekly AOI:** Place TP at or just below the closest respected weekly structure point (e.g., current LL in a bearish market).
 - If trading from both a Weekly and Daily AOI, select the closest respected point across both timeframes.
 - You should adjust TP to just before a strong AOI when selling from a Daily AOI into a Weekly AOI with a bullish weekly trend.
- **No Partial:**
 - Avoid taking partial profits. The strategy's win rate negates the need for partial exits and maximizes profits.

Stop Loss (SL)

- **Definition:** A level to cap losses if price moves in the opposite direction.
- **Placement:**
 - Place SL **5–7 pips** under the AOI (for buys) or above it (for sells).

- This placement provides room for price fluctuations and avoids premature exit while also being at a level where if price crosses, the trend will shift in the wrong direction and the trade is wrong.
- **No Adjustments to SL:**
 - Do not move the stop loss after placement. Trust the initial plan and allow for potential drawdowns within the SL.

Risk-to-Reward (RR)

- **Minimum RR: 1:2 or 1:2.5.**
 - Example: With a 50%-win rate (5 wins, 5 losses) and 1% risk per trade:
 - Losses: 5 trades x 1% = 5%.
 - Wins: 5 trades x 2.5% = 12.5%.
 - Net profit: 12.5% - 5% = 7.5%.
- Avoid trades with an RR below the minimum threshold.

General Rules

- Never move SL to breakeven. Allow the trade to develop fully.
- Adhere strictly to planned SL and TP levels to maintain consistency and strategy integrity.

Confluence Checklists

- Consecutive In-Sync Timeframes W, D, 4hr (20-30%)

Swing/Inter-Day Trade (W and D In-Sync)

WEEKLY/DAILY CHECKLIST:

- At/Rejected W AOI 10%
- At/Rejected D AOI 10%
- Touching/Rejecting W 50 EMA 5%
- Touching/Rejecting D 50 EMA 5%
- Round Psychological Level 5%

- Rejection from W previous structure point 10%
- Rejection from D previous structure point 10%
- W Candlestick Rejection 10%
- D Candlestick Rejection 10%
- W Patterns - Head and Shoulders, Double Top or Bottom 10%
- D Patterns - Head and Shoulders, Double Top or Bottom 10%

4HR CHECKLIST:

- Touching/rejecting 50 EMA 5%
- Candlestick Rejection 10%
- Rejection from previous structure point 5%
- Patterns 10%

ENTRY CHECKLIST:

- Shift of Structure 10% - Required
- Engulfing Candlestick 10% - Required
- Pattern – 5%
- 1:2.5 RR Minimum – No Grade

Day Trade (D and 4hr In-Sync)

DAILY/4HR:

- At/Rejected D AOI 10%
- At/Rejected 4hr AOI 5%
- Touching/Rejecting D 50 EMA 5%
- Touching/Rejecting 4hr 50 EMA 5%
- Round Psychological Level 5%
- Rejection from D previous structure point 10%
- Rejection from 4hr previous structure point 5%
- D Candlestick Rejection 10%
- 4hr Candlestick Rejection 10%

- D Patterns - Head and Shoulders, Double Top or Bottom 10%
- 4hr Patterns - Head and Shoulders, Double Top or Bottom 10%

ENTRY CHECKLIST:

- Shift of Structure 10% - Required
- Engulfing Candlestick 10% - Required
- Pattern – 5%
- 1:2.5 RR Minimum – No Grade

Scalp Trade

- The strategy is the same here, however uses confluences on lower timeframes
- These confluences have a lower percentage, as they aren't as likely indicators as those on the stronger timeframes
- This isn't recommended but it's just to show that the strategy works
- It's never necessary to do these trades since there are always high-quality textbook trades available
- Each consecutive time frame in sync is 5% (4hr, 2hr, 1hr)

4Hr and 2Hr In-Sync

4HR/2HR CHECKLIST:

- At/Rejected 4hr AOI 5%
- At/Rejected 2hr AOI 5%
- Touching/Rejecting 4hr 50 EMA 5%
- Touching/Rejecting 2hr 50 EMA 5%
- Round Psychological Level 5%
- Rejection from 4hr previous structure point 5%
- Rejection from 2hr previous structure point 5%
- 4hr Candlestick Rejection 5%
- 2hr Candlestick Rejection 5%
- 4hr Patterns - Head and Shoulders, Double Top or Bottom 5%

- 2hr Patterns - Head and Shoulders, Double Top or Bottom 5%

1HR CHECKLIST:

- Touching/rejecting 50 EMA 5%
- Candlestick Rejection 5%
- Rejection from previous structure point 5%
- Patterns 5%

2hr and 1hr In-Sync

DAILY/4HR:

- At/Rejected 2hr AOI 5%
- At/Rejected 1hr AOI 5%
- Touching/Rejecting 2hr 50 EMA 5%
- Touching/Rejecting 1hr 50 EMA 5%
- Round Psychological Level 5%
- Rejection from 2hr previous structure point 5%
- Rejection from 1hr previous structure point 5%
- 2hr Candlestick Rejection 5%
- 1hr Candlestick Rejection 5%
- 2hr Patterns - Head and Shoulders, Double Top or Bottom 5%
- 1hr Patterns - Head and Shoulders, Double Top or Bottom 5%

ENTRY CHECKLIST (1hr, 30min, 15min):

- Shift of Structure 10%
- Engulfing Candlestick 10%
- RR Minimum 1:2.5

Risk Management

Seasonal Trends in Trading

- **Best Months:** January–March and October–December are historically the most profitable months for trading.

- **Slow Months:** June and July are typically the slowest and least profitable months.
- **Average Months:** April, May, August, and September provide moderate trading opportunities.

Risk Allocation

- **Best Months (Jan-Mar, Oct-Dec):**
 - **Live Accounts:** Risk 2-4% per trade.
 - **Funded Accounts:** Risk 2-3% per trade.
 - **Challenge Accounts:** Risk 0.5-1.5% per trade.
- **Slow Months (June, July):**
 - **Live Accounts:** Risk 2% per trade.
 - **Funded Accounts:** Risk 1% per trade.
 - **Challenge Accounts:** Risk 0.5-1% per trade.
- **Average Months (Apr, May, Aug, Sep):**
 - **Live Accounts:** Risk 2-3% per trade.
 - **Funded Accounts:** Risk 1-2% per trade.
 - **Challenge Accounts:** Risk 0.5-1% per trade.

Guidelines for Risk Management

1. Start Small:

- Begin by risking amounts on the lower to medium end of the specified ranges. This helps you become comfortable with managing risk and handling losses.

2. Consistency:

- Choose a percentage based on the time of year and stick to it consistently throughout that period.
- Maintain the same risk percentage for all trades, regardless of trade quality (e.g., "good grade" or "textbook" vs. lesser-grade setups).

3. Trade Frequency:

- Focus on quality over quantity. Aim to trade only **1-2 high-quality setups per week** at most.

By following these risk guidelines and aligning your strategy with seasonal trends, you can manage your capital effectively and maximize profitability throughout the year.

Market Sessions

High-Volume Trading Sessions

- **Best Sessions:**
 - **London Session:** Offers high liquidity and significant market movements.
 - **New York Session:** Features strong market activity and impactful price moves.
 - **London-New York Overlap:** The period where both sessions overlap is when the highest volume occurs, leading to larger and more predictable price movements.
- **Worst Sessions:**
 - **Sydney Session:** Generally low volume and limited market movement.

- **Tokyo Session:** Also characterized by lower volatility and fewer opportunities for significant trades.

Trading Execution Timing

- To minimize costs and maximize profitability:
 - Execute trades **from the start of the London session** to up to **2 hours before the New York session closes**.
 - This timing ensures the **smallest spreads** and **lowest fees** for trade execution.

Trade Grading

Confluences and Trade Probability

- Each **confluence** in a trade setup is assigned a specific **percentage weight**, reflecting its importance and contribution to the overall probability of success.
- Combining multiple confluences results in a **higher cumulative percentage**, indicating a **higher-probability trade**.

Grading System

- Trades are graded based on their total percentage score, using the following scale:
 - **A:** 90% or higher
 - **B:** 80% or higher
 - **C:** 70% or higher
 - **D:** 60% or higher
 - **F:** 50% or higher

High-Probability Trades

- Grades can exceed **100%**, indicating an exceptionally strong setup with a very high likelihood of success. Such setups are ideal for execution.
